Professor Kyung-San Min, DDS, PhD
Editor-in-Chief
Restorative Dentistry & Endodontics
The Korean Academy of Conservative Dentistry

Dear Professor Min,

On behalf of all authors, I am pleased to submit our manuscript entitled “Multidisciplinary management of invasive cervical resorption using bioceramic materials and injectable composite guided by CBCT: a case report” for consideration as a Case Report in Restorative Dentistry & Endodontics.

This case report describes the multidisciplinary management of Heithersay Class III invasive cervical resorption affecting the maxillary left central incisor of a 35-year-old female patient with a history of dental trauma and fixed orthodontic treatment. The diagnosis was established using clinical examination, periapical radiography, and cone-beam computed tomography. Management included root canal treatment using gutta-percha and a bioceramic sealer, surgical flap access, curettage and disinfection of the resorptive defect, repair with mineral trioxide aggregate, and subsequent cervical restoration using injectable composite. At the six-month follow-up, the tooth remained asymptomatic, gingival tissues were healthy, and radiographic findings showed no periapical pathology.

We believe this case is relevant to readers of Restorative Dentistry & Endodontics because it illustrates the value of three-dimensional diagnostic assessment, biocompatible endodontic repair materials, and coordinated conservative dentistry, oral surgery, oral radiology, and restorative decision-making in the preservation of a tooth with advanced invasive cervical resorption.

We confirm that this manuscript is original, has not been published previously, and is not currently under consideration by another journal. All authors have read and approved the final manuscript and agree with its submission to Restorative Dentistry & Endodontics.

Written informed consent was obtained from the patient for treatment and for publication of this case report and the accompanying clinical and radiographic images. The case information has been prepared in de-identified form. The authors declare that no potential conflict of interest relevant to this article was reported. No funding was received for this case report.

The corresponding author and co-authors' contact information are provided below for editorial correspondence and verification.
