

Medicinal Plant-Based Interventions for Lipid Profile Improvement in Dyslipidemia

Graphical abstract - systematic review of clinical evidence and pharmacological mechanisms

Key synthesis message

Across 24 interventional studies, plant-derived interventions showed the strongest and most consistent lipid-modifying signals for total cholesterol and LDL-C. HDL-C and triglyceride responses were less uniform and appeared to depend on baseline metabolic phenotype, formulation, dosage, duration, and extract standardization.

Evidence base

24 clinical studies

Review type

Systematic review

Population

Adults with dyslipidemia or metabolic conditions

Main role

Adjunct phytopharmaceutical strategy
