Subject: Submission of manuscript of “Effect of Soleus Muscle Exercise With and Without Additional Weight on Blood Glucose Among Adults With Type 2 Diabetes Mellitus: A Cross-Over Study”

Dear Chief Editor,

I am **Cholik Harun Rosjidi**, on behalf of my co-authors, and I would like to submit our original article entitled “*Effect of Soleus Muscle Exercise With and Without Additional Weight on Blood Glucose Among Adults With Type 2 Diabetes Mellitus: A Cross-Over Study*” for consideration for publication in the Journal of Nepal Health Research Council.

Physical activity is an established component of non-pharmacological management for type 2 diabetes mellitus. Skeletal muscle contraction enhances glucose uptake through improved oxidative metabolism and increased GLUT4 translocation. Although resistance and aerobic exercises are known to improve glycemic control, clinical evidence focusing specifically on targeted soleus muscle activation in primary health care settings remains limited.

This study provides clinical evidence that soleus muscle exercise significantly reduces blood glucose levels in adults with type 2 diabetes mellitus. Furthermore, the addition of light resistance (1 kg load) resulted in greater glucose reduction compared to exercise without load. These findings suggest that a simple, localized, and low-intensity exercise strategy may be practical and feasible for community-based diabetes management.
